AB The present invention relates to methods for detection and evaluation of metabolic activity of eukaryotic and/or prokaryotic cells based upon their ability to consume dissolved oxygen. The methods utilize a luminescence detection system which makes use of the sensitivity of the luminescent emission of certain compds. to the presence of oxygen, which quenches (diminishes) the compound's luminescent emission in a concentration dependent manner. Respiring eukaryotic and/or prokaryotic cells will affect the oxygen concentration of a liquid medium in which they are immersed. Thus, this invention provides a convenient system to gather information on the presence, identification, quantification and cytotoxic activity of eukaryotic and/or prokaryotic cells by determining their effect on the oxygen concentration of the media in which they are present.

AB The present invention relates to a method for detecting the presence of respiring microorganisms in a fluid. It is an object of this invention to provide an improved means to detect the presence of, and to evaluate the metabolic activity of, microorganisms present in a liquid or semi-solid media. It is further an object of this invention to provide a microbial monitoring device or system which can be simply read and visually interpreted, and which permits results to be obtained in a shorter time period than previously attainable, nominally 6 h or less. These processes use a fluorescence detection system wherein the fluorescing sensor compound is one which exhibits a quantifiable degree of quenching when exposed to oxygen, including tris-4,7-diphenyl-1,10-phenanthroline ruthenium (II) chloride, tris-2,2'-bipyridyl ruthenium (II) chloride hexahydrate and 9,10-diphenyl anthracene.

AB An apparatus for measuring light in samples using a high intensity light source, is presented. The system uses bifurcated fiber bundles to transmit light at the excitation and emission wavelength bands. It also uses a band-pass filter for eliminating extraneous light, including that which corresponds to the excitation wavelength range, while permitting the emitted light to pass to a detector for quantitation. The system employs a shutter to shield the detector while the laser light source is activated, and a controller to intermittently activate the laser light and close the shutter. The apparatus preferably includes lenses for better illumination and read out conditions. The apparatus is employed in Luminescence Oxygen Channeling Immunoassays. The method has high sensitivity, accuracy and precision, and the apparatus is highly compact. Accordingly, the analyzer can perform assays in nanoliter to microliter sample vols. in standard microplates having at least 96, 384 or 1536 wells.

 AB The present invention relates to cell culture. In particular, this invention is directed to methods and apparatuses used to observe or quantitate cell proliferation in the presence of potential growth promoting mols. in a two or three dimensional architecture. Further, the invention provides methods, apparatuses and kits which can be used in assays for the effects of different materials, bioactive agents, or combinations thereof on cells in two or three dimensional culture. In particular, the invention provides a method for determining the presence or absence of respiring cells which includes depositing a three-dimensional biomimetic scaffold and cells onto a sensor composition, the sensor composition including a luminescent compound that exhibits a change in luminescent property when irradiated with light containing wavelengths which cause said compound to luminesce upon exposure to oxygen and then irradiating the sensor composition with light to cause luminescence, followed by determining the resultant luminescent light intensity emitted and determining whether said resultant luminescent light intensity emitted is indicative of the presence or absence of respiring cells. The system also can be used in cytotoxicity assays for the effects of drugs, toxins, or chems. on eukaryotic or prokaryotic cells.

AB The present invention relates to methods for detection and evaluation of metabolic activity of eukaryotic and/or prokaryotic cells based upon their ability to consume dissolved oxygen. The methods utilize a luminescence detection system which makes use of the sensitivity of the luminescent emission of certain compds. to the presence of oxygen, which quenches (diminishes) the compound's luminescent emission in a concentration dependent manner. Respiring eukaryotic and/or prokaryotic cells will affect the oxygen concentration of a liquid medium in which they are immersed. Thus, this invention provides a convenient system to gather information on the presence, identification, quantification and cytotoxic activity of eukaryotic and/or prokaryotic cells by determining their effect on the oxygen concentration of the media in which they are present.

AB Apparatus or systems which employ luminescence quenching to produce an oxygen concentration indicative signal. Components of such systems include: (1) an airway adapter, sampling cell, or the like having a sensor which is excited into luminescence with the luminescence decaying in a manner reflecting the concentration of oxygen in gases flowing through the airway adapter or other flow device; (2) a transducer which has a light source for exciting a luminescable composition in the sensor into luminescence and a light sensitive detector for converting energy emitted from the luminescing composition as that composition is quenched into an elec. signal indicative of oxygen concentration in the gases being monitored; and (3) subsystems for maintaining the sensor temperature constant and for processing the signal generated by the light sensitive detector. Sensors for systems of the character just described, methods of fabricating those sensors, and methods for installing the sensors in the flow device.

ST **oxygen** monitoring app

IT Pressure

(Atmospheric; **oxygen** monitoring apparatus)

IT Porphyrins

RL: ARG (Analytical reagent use); ANST (Analytical study); USES (Uses)

(Fluorinated; **oxygen** monitoring apparatus)

IT Organometallic compounds

RL: ARG (Analytical reagent use); ANST (Analytical study); USES (Uses)

(Phosphorescent; **oxygen** monitoring apparatus)

IT Polycarbonates, uses

RL: NUU (Other use, unclassified); USES (Uses)

(Track-etched; **oxygen** monitoring apparatus)

IT Pipes and Tubes

(conduits; **oxygen** monitoring apparatus)

IT Apparatus

(flow device; **oxygen** monitoring apparatus)

IT Polymers, **analysis**
 RL: ANT (Analyte); ANST (Analytical study)
 (hydrophobic; **oxygen** monitoring apparatus)
